Cost

When, $H(x) = Wx + b$

$$\text{cost}(W,b) = \frac{1}{m} \sum_{i=1}^{m} (H(x^{(i)}) - y^{(i)})^2$$
Cost Function

$$cost(W,b) = \frac{1}{m}\sum_{i=1}^{m}(H(x^{(i)})-y^{(i)})^2$$

$$H(x) = W+b$$

$$H(x) = \frac{1}{1+e^{-W^T x}}$$

New Cost Function for Logistic

$$cost(W) = \frac{1}{m}\sum c(H(x),y)$$

$$c(H(x),y) = \begin{cases} -\log(H(x)) & :y=1 \\ -\log(1-H(x)) & :y=0 \end{cases}$$

Understanding Cost Function

$$c(H(x),y) = \begin{cases} -\log(H(x)) & :y=1 \\ -\log(1-H(x)) & :y=0 \end{cases}$$

(A) -log(x)

(B) -log(1-x)

Cost Function

$$cost(W) = \frac{1}{m}\sum c(H(x),y)$$

$$c(H(x),y) = \begin{cases} -log(H(x)) & :y=1 \\ -log(1-H(x)) & :y=0 \end{cases}$$

$$C(H(x),y) = -ylog(H(x))-(1-y)log(1-H(x))$$

$$= -(ylog(H(x)+(1-y)log(1-H(x)))$$

Minimize Cost

Gradient Descent Algorithm

$$\text{cost}(W) = -\frac{1}{m}\sum y\log(H(x)) + (1-y)\log(1-H(x))$$

$$W := W - \alpha\frac{\partial}{\partial W}\text{cost}(W)$$

Gradient Descent Algorithm

$$cost(W) = -\frac{1}{m}\sum y\log(H(x))+(1-y)\log(1-H(x))$$

$$W := W - \alpha\frac{\partial}{\partial W}cost(W)$$

```
# cost function
cost = tf.reduce_mean(-tf.reduce_sum(Y*tf.log(hypothesis) + (1-Y)*tf.log(1-hypothesis)))

# Minimize
a = tf.Variable(0.1) # Learning rate, alpha
optimizer = tf.train.GradientDescentOptimizer(a)
train = optimizer.minimize(cost)
```

MULTINOMIAL CLASSIFICATION (SOFTMAX)
